- Tomasulo Algorithm
- Branch Prediction

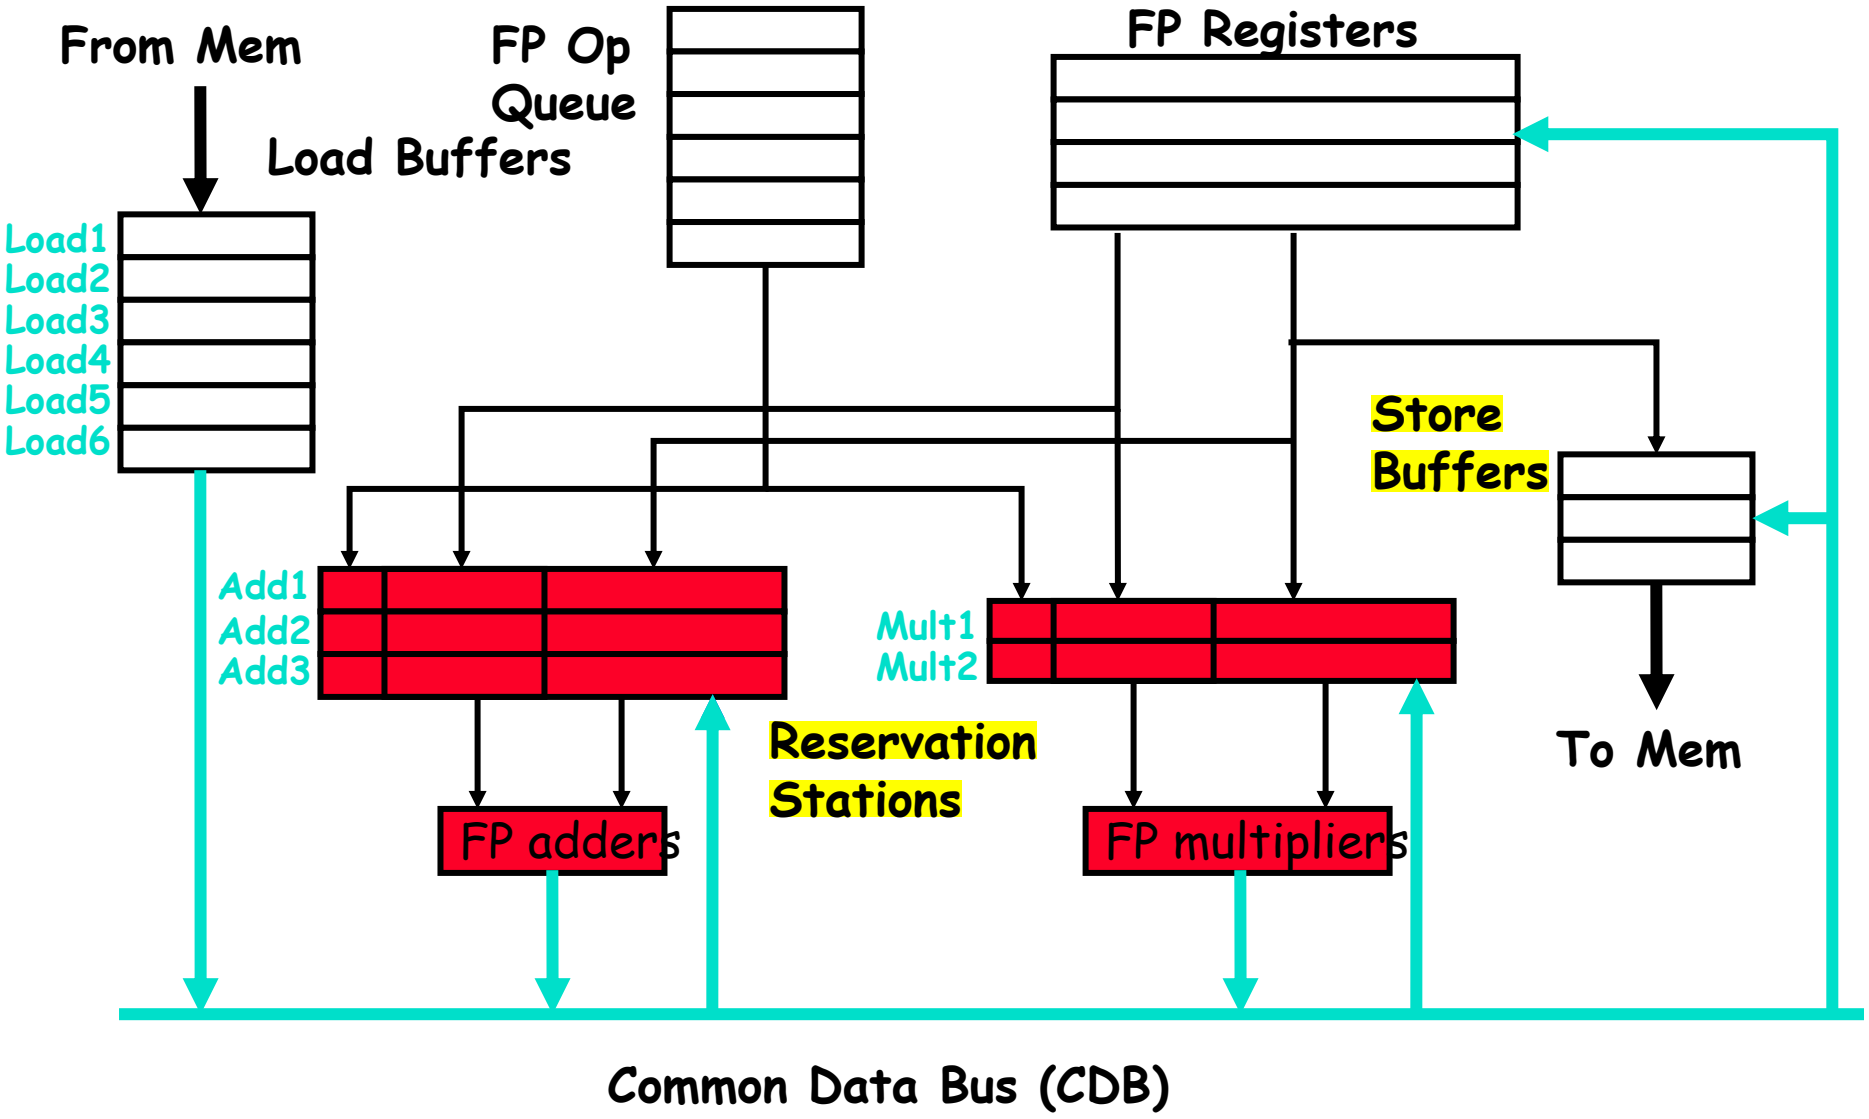
From : H&P Computer Architecture: A Quantitative Approach, Fifth Edition, （5th edition)

A Dynamic Algorithm: Tomasulo Algorithm

- For IBM 360/91 about 3 years after CDC 6600 (1966)
- Goal: High Performance without special compilers

- Why Study? lead to Alpha 21264, HP 8000, MIPS 10000, Pentium II, PowerPC 604, …

Tomasulo Organization



Tomasulo Algorithm vs. Scoreboard

- Control & buffers distributed with Function Units (FU) vs. centralized in scoreboard;
  - FU buffers called "reservation stations"; have pending operands
- Registers in instructions replaced by values or pointers to reservation stations(RS); called register renaming ;
  - avoids WAR, WAW hazards
  - More reservation stations than registers, so can do optimizations compilers can't
- Results to FU from RS, not through registers, over Common Data Bus that broadcasts results to all FUs
- Load and Stores treated as FUs with RSs as well
- Integer instructions can go past branches, allowing FP ops beyond basic block in FP queue

Reservation Station Components

Op: Operation to perform in the unit (e.g., + or –)

Vj, Vk: Value of Source operands

- Store buffers has V field, result to be stored

Qj, Qk: Reservation stations producing source registers (value to be written)

- Note: No ready flags as in Scoreboard; Qj,Qk=0 => ready
- Store buffers only have Qi for RS producing result

Busy: Indicates reservation station or FU is busy

Register result status—Indicates which functional unit will write each register, if one exists. Blank when no pending instructions that will write that register.

Three Stages of Tomasulo Algorithm

1. Issue—get instruction from FP Op Queue

   If reservation station free (no structural hazard),
   control issues instr & sends operands (renames registers).

2. Execution—operate on operands (EX)

   When both operands ready then execute;
   if not ready, watch Common Data Bus for result

3. Write result—finish execution (WB)

   Write on Common Data Bus to all awaiting units;
   mark reservation station available

- Normal data bus: data + destination ("go to" bus)
- Common data bus: data + source ("come from" bus)

  64 bits of data + 4 bits of Functional Unit source address

  Write if matches expected Functional Unit (produces result)

  Does the broadcast

- Why take longer on scoreboard/6600?
  - Structural Hazards
  - Lack of forwarding

FP Loop: Where are the Hazards?

```
Loop:  LD    F0,0(R1)   ;F0=vector element
       ADDD  F4,F0,F2   ;add scalar from F2
       SD    0(R1),F4   ;store result
       SUBI  R1,R1,8    ;decrement pointer 8B (DW)
       BNEZ  R1,Loop    ;branch R1!=zero
       NOP              ;delayed branch slot
```

Instruction producing result	*Instruction using result*	*Execution Latency in clock cycles*	*Use Latency in clock cycles*
FP ALU op	Another FP ALU op	4	3
FP ALU op	Store double	4	2
Load double	FP ALU op	2	1
Load double	Store double	2	0
Integer op	Integer op	1	0

- Where are the stalls?

FP Loop Showing Stalls

```
1 Loop: LD    F0,0(R1)   ;F0=vector element
2       stall
3       ADDD  F4,F0,F2   ;add scalar in F2
4       stall
5       stall
6       SD    0(R1),F4   ;store result
7       SUBI  R1,R1,8    ;decrement pointer 8B (DW)
8       BNEZ  R1,Loop    ;branch R1!=zero
9       stall            ;delayed branch slot
```

Instruction producing result	*Instruction using result*	*Use Latency in clock cycles*
FP ALU op	Another FP ALU op	3
FP ALU op	Store double	2
Load double	FP ALU op	1

- 9 clocks: Rewrite code to minimize stalls?

Revised FP Loop Minimizing Stalls (static scheduling)

```
1 Loop: LD    F0,0(R1)
2       stall
3       ADDD  F4,F0,F2
4       SUBI  R1,R1,8
5       BNEZ  R1,Loop    ;delayed branch
6       SD    8(R1),F4   ;altered when move past SUBI
```

Swap BNEZ and SD by changing address of SD

Instruction producing result	*Instruction using result*	*Use Latency in clock cycles*
FP ALU op	Another FP ALU op	3
FP ALU op	Store double	2
Load double	FP ALU op	1

6 clocks: Unroll loop 4 times code to make faster?

Unroll Loop Four Times (straightforward way)

```
1  Loop:LD     F0,0(R1)
2       ADDD   F4,F0,F2
3       SD     0(R1),F4      ;drop SUBI & BNEZ
4       LD     F6,-8(R1)
5       ADDD   F8,F6,F2
6       SD     -8(R1),F8     ;drop SUBI & BNEZ
7       LD     F10,-16(R1)
8       ADDD   F12,F10,F2
9       SD     -16(R1),F12   ;drop SUBI & BNEZ
10      LD     F14,-24(R1)
11      ADDD   F16,F14,F2
12      SD     -24(R1),F16
13      SUBI   R1,R1,#32     ;alter to 4*8
14      BNEZ   R1,LOOP
15      NOP
```

1 cycle stall

2 cycles stall

Rewrite loop to minimize stalls?

15 + 4 x (1+2) = 27 clock cycles, or 6.8 per iteration

Assumes R1 is multiple of 4

Recall: Unrolled Loop That Minimizes Stalls

```
1  Loop:LD     F0,0(R1)
2       LD     F6,-8(R1)
3       LD     F10,-16(R1)
4       LD     F14,-24(R1)
5       ADDD   F4,F0,F2
6       ADDD   F8,F6,F2
7       ADDD   F12,F10,F2
8       ADDD   F16,F14,F2
9       SD     0(R1),F4
10      SD     -8(R1),F8
11      SD     -16(R1),F12
12      SUBI   R1,R1,#32
13      BNEZ   R1,LOOP
14      SD     8(R1),F16    ; 8-32 = -24
```

- What assumptions made when moved code?
  - OK to move store past SUBI even though changes register
  - OK to move loads before stores: get right data?
  - When is it safe for compiler to do such changes?

14 clock cycles, or 3.5 per iteration
(static scheduling)

Tomasulo Loop Example

```
Loop: LD      F0    0     R1
      MULTD   F4    F0    F2
      SD      F4    0     R1
      SUBI    R1    R1    #8
      BNEZ    R1    Loop
```

- Assume Multiply takes 4 clocks
- Assume first load takes 8 clocks (cache miss), second load takes 1 clock (hit)
- To be clear, will show clocks for SUBI, BNEZ
- Reality: integer instructions ahead

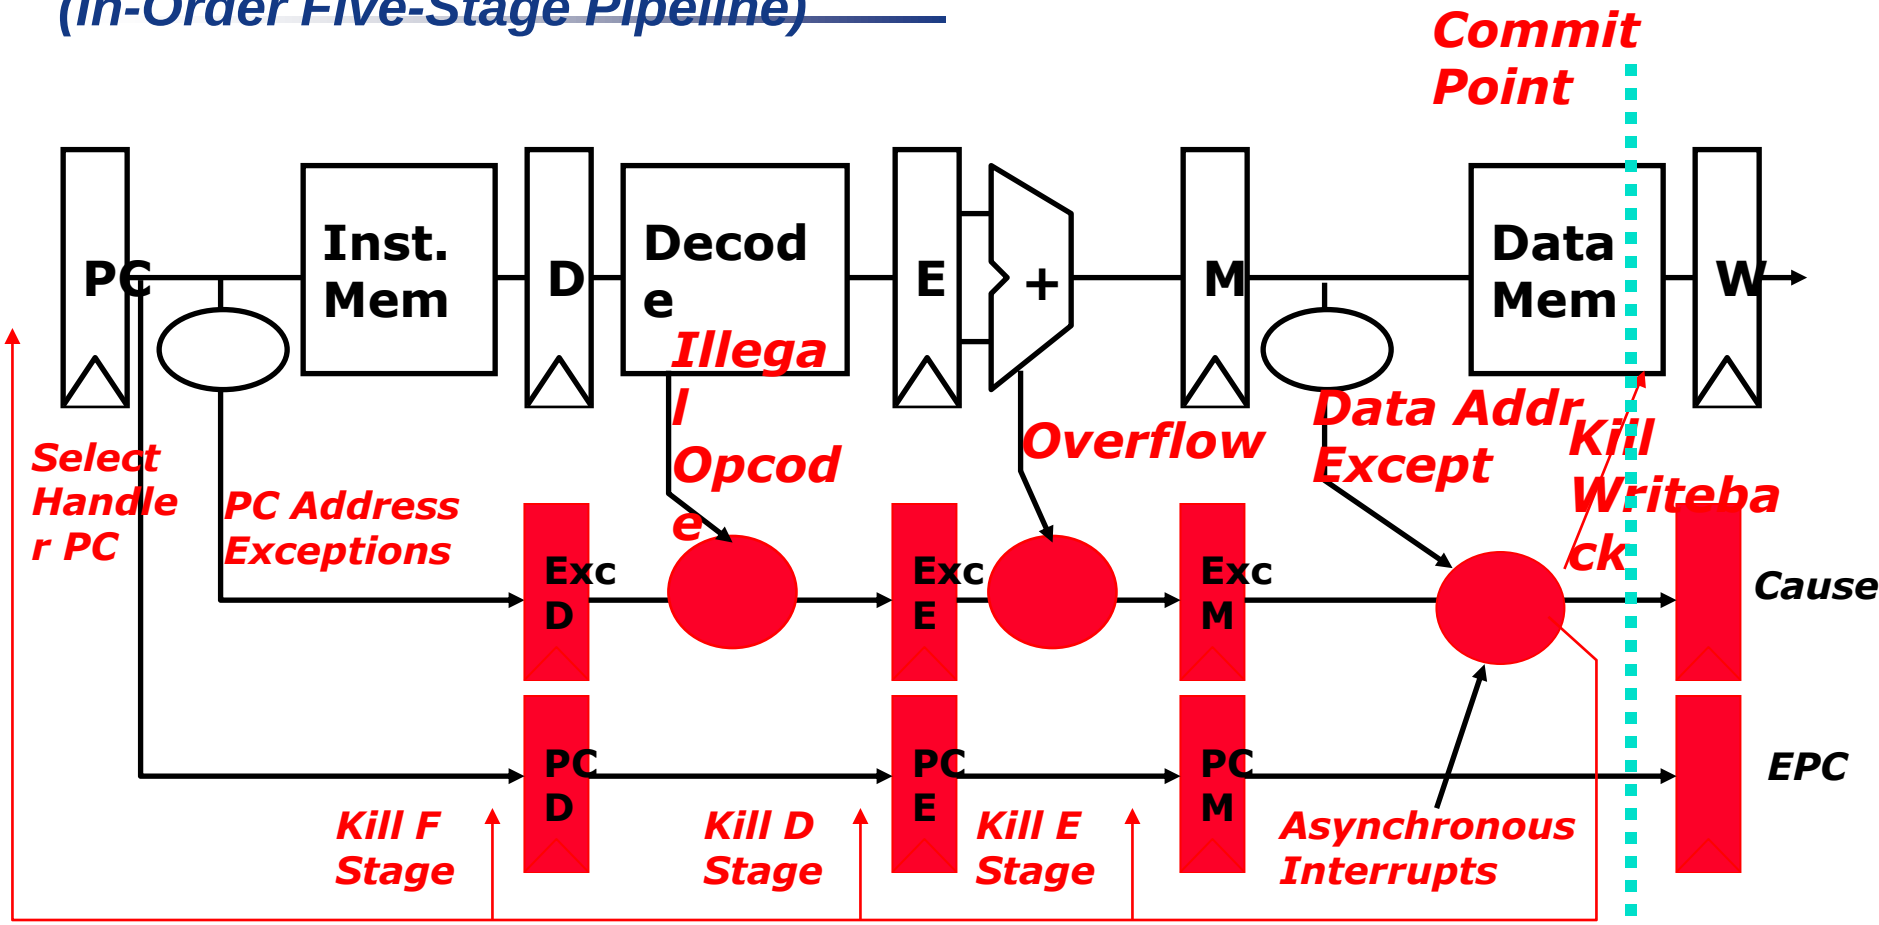
Why can Tomasulo overlap iterations of loops?

- Register renaming
  - Multiple iterations use different physical destinations for registers (dynamic loop unrolling).
- Reservation stations
  - Permit instruction issue to advance past integer control flow operations
- Other idea: Tomasulo building dynamic "DataFlow" graph from instructions
  - Fits in with readings for Wednesday

What about Precise Exceptions/Interrupts?

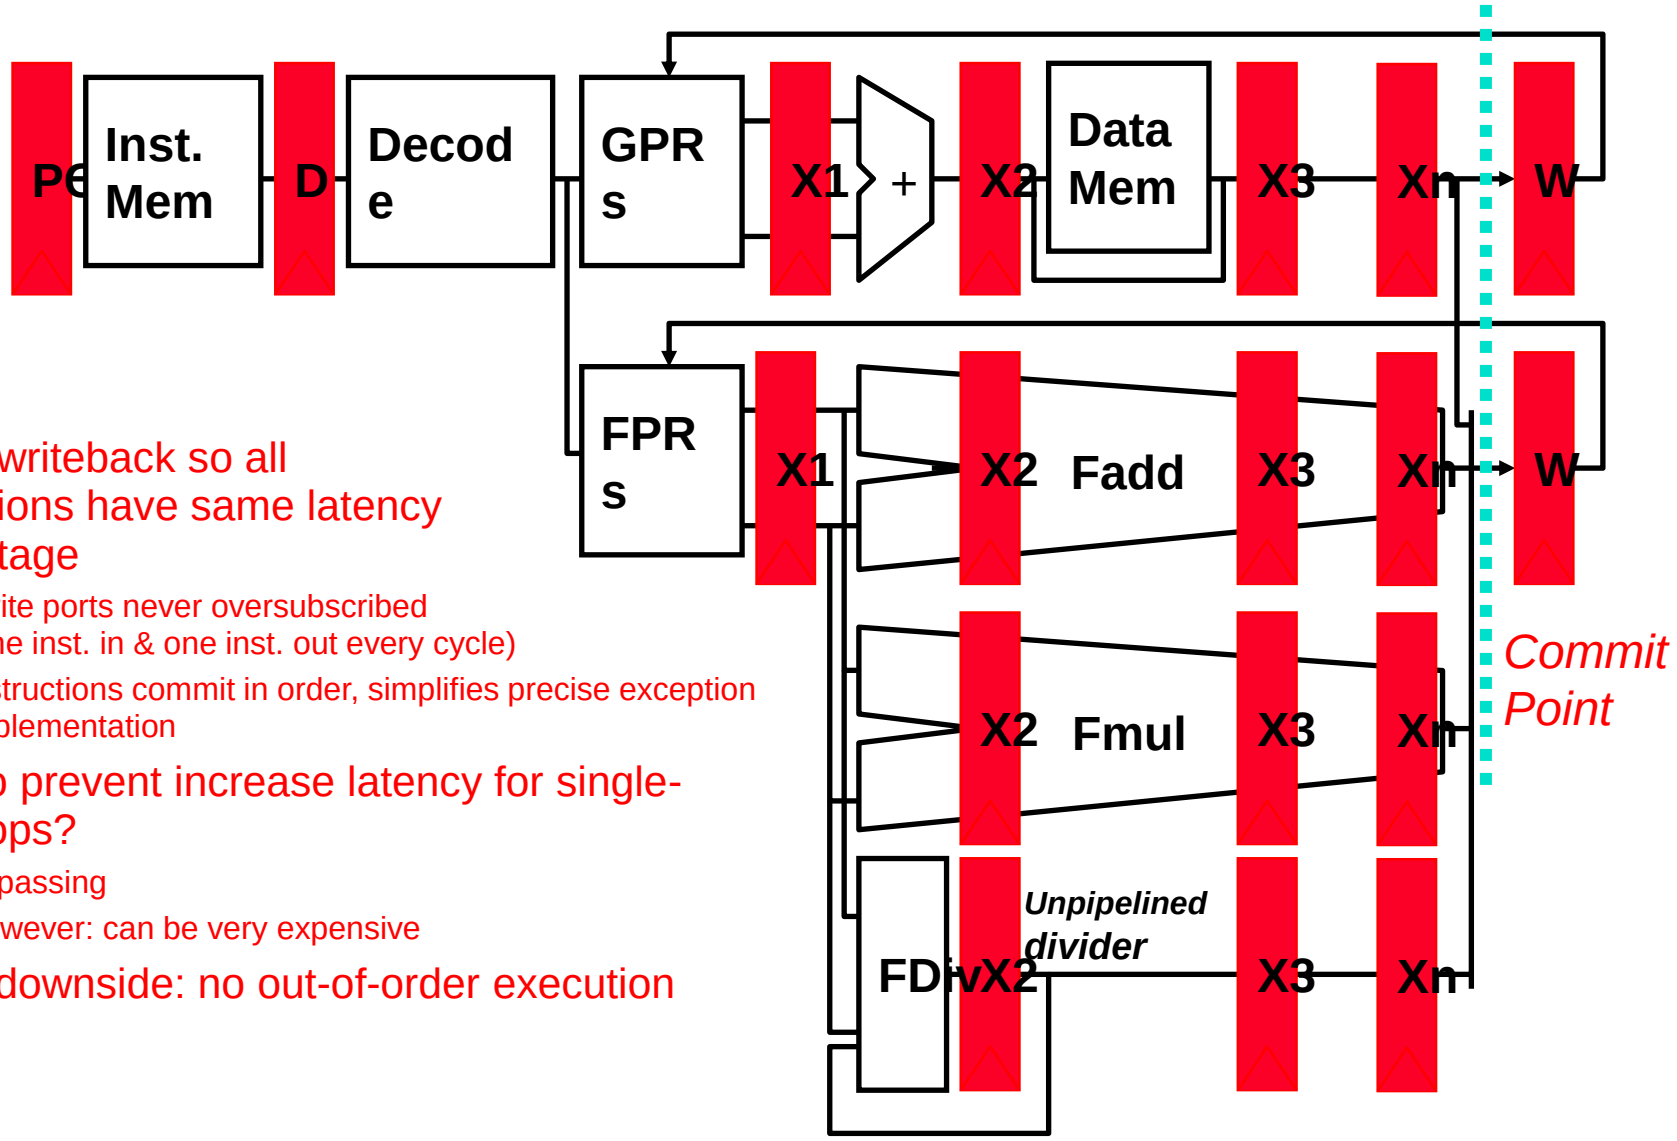
- Both Scoreboard and Tomasulo have:
  - *In-order issue, out-of-order execution, out-of-order completion*
- Recall: An interrupt or exception is *precise* if there is a single instruction for which:
  - All instructions before that have committed their state
  - No following instructions (including the interrupting instruction) have modified any state.
- Need way to resynchronize execution with instruction stream (I.e. with issue-order)
  - Easiest way is with *in-order completion (i.e. reorder buffer)*
  - Other Techniques (Smith paper): Future File, History Buffer

Exception Handling
(In-Order Five-Stage Pipeline)



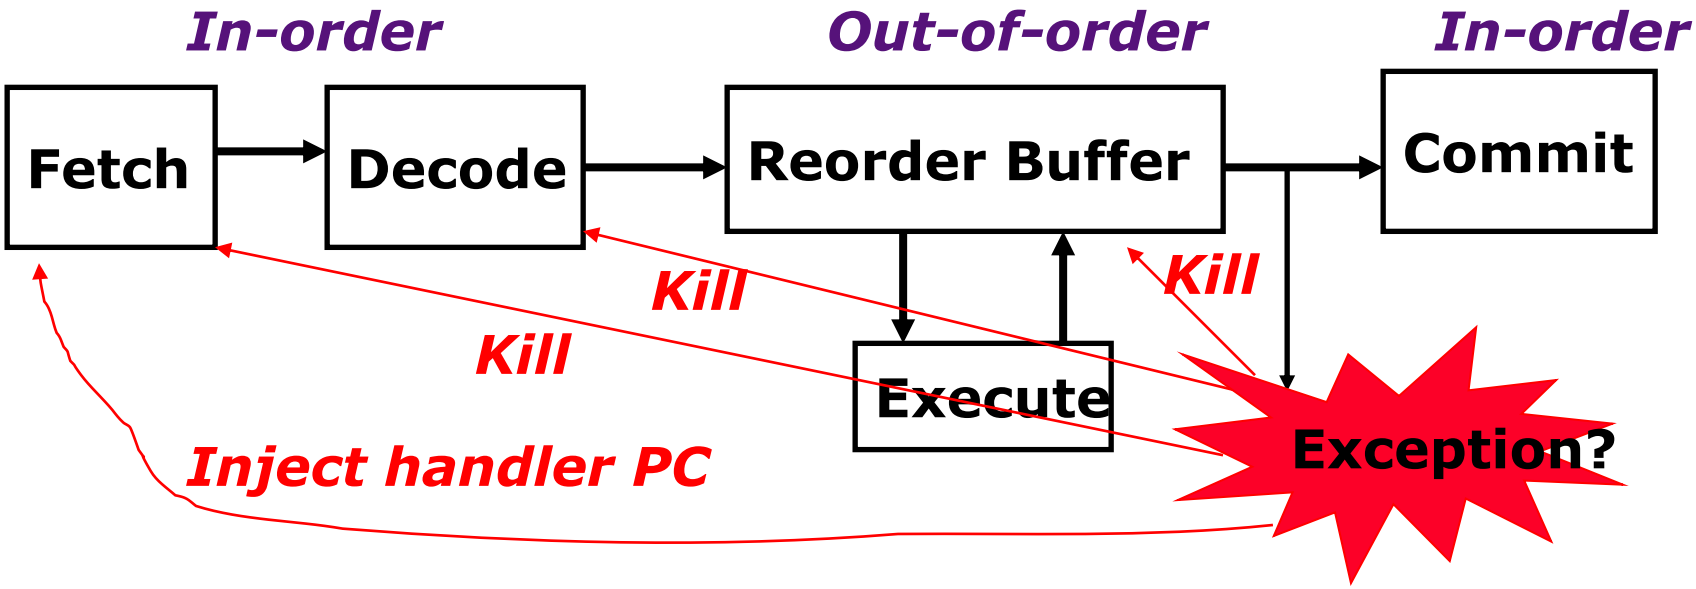
- Hold exception flags in pipeline until commit point (M stage)
- Exceptions in earlier pipe stages override later exceptions
- Inject external interrupts at commit point (override others)
- If exception at commit: update Cause and EPC registers, kill all stages, inject handler PC into fetch stage

Complex In-Order Pipeline: Precise Exceptions



- Delay writeback so all operations have same latency to W stage
  - Write ports never oversubscribed (one inst. in & one inst. out every cycle)
  - Instructions commit in order, simplifies precise exception implementation
- How to prevent increase latency for single-cycle ops?
  - Bypassing
  - However: can be very expensive
- Other downside: no out-of-order execution

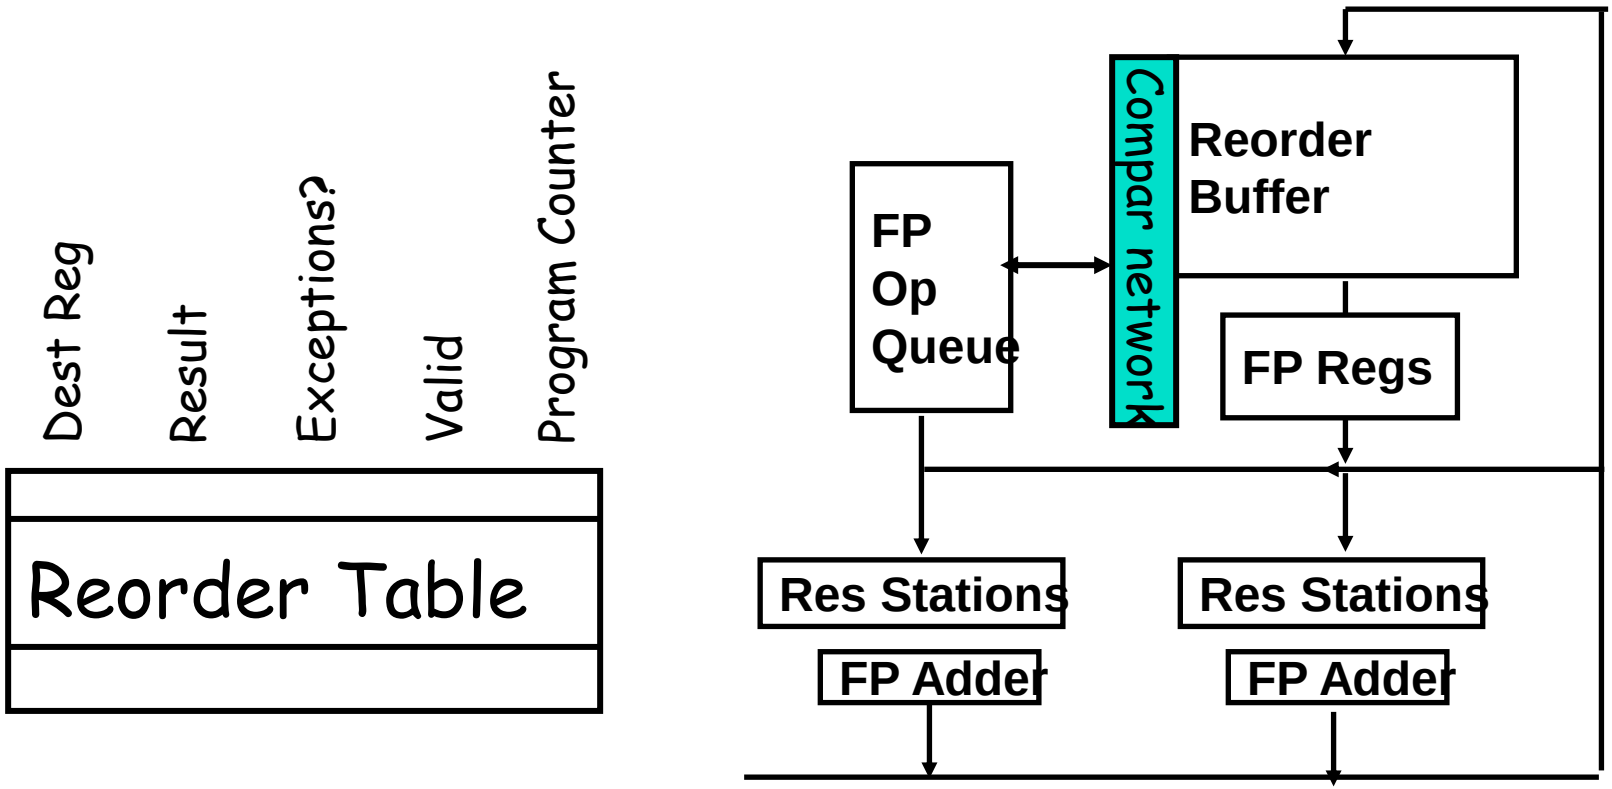
In-Order Commit for Precise Exceptions



- Instructions fetched and decoded into instruction reorder buffer in-order
- Execution is out-of-order (⇒ out-of-order completion)
- *Commit* (write-back to architectural state, i.e., regfile & memory) is in-order

Temporary storage needed to hold results before commit (shadow registers and store buffers)

What are the hardware complexities with reorder buffer (ROB)?



- How do you find the latest version of a register?
  - As specified by Smith paper, need associative comparison network
  - Could use future file or just use the register result status buffer to track which specific reorder buffer has received the value
- Need as many ports on ROB as register file

Four Steps of *Speculative* Tomasulo

1. Issue—get instruction from FP Op Queue

   If reservation station and reorder buffer slot free, issue instr & send operands & reorder buffer no. for destination (this stage sometimes called "dispatch")

2. Execution—operate on operands (EX)

   When both operands ready then execute; if not ready, watch CDB for result; when both in reservation station, execute; checks RAW (sometimes called "issue")

3. Write result—finish execution (WB)

   Write on Common Data Bus to all awaiting FUs
   & reorder buffer; mark reservation station available.

4. Commit—update register with reorder result

   When instr. at head of reorder buffer & result present, update register with result (or store to memory) and remove instr from reorder buffer. Mispredicted branch flushes reorder buffer (sometimes called "graduation")

Relationship between precise interrupts and speculation:

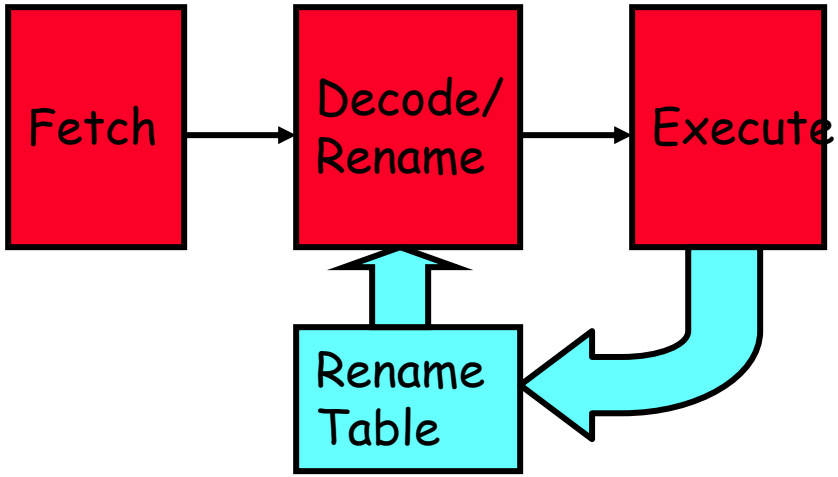
- Speculation is a form of guessing
  - Branch prediction, data prediction
  - If we speculate and are wrong, need to back up and restart execution to point at which we predicted incorrectly
  - This is exactly same as precise exceptions!

- Branch prediction is a very important!
  - Need to “take our best shot” at predicting branch direction.
  - If we issue multiple instructions per cycle, lose lots of potential instructions otherwise:
    - Consider 4 instructions per cycle
    - If take single cycle to decide on branch, waste from 4 - 7 instruction slots!

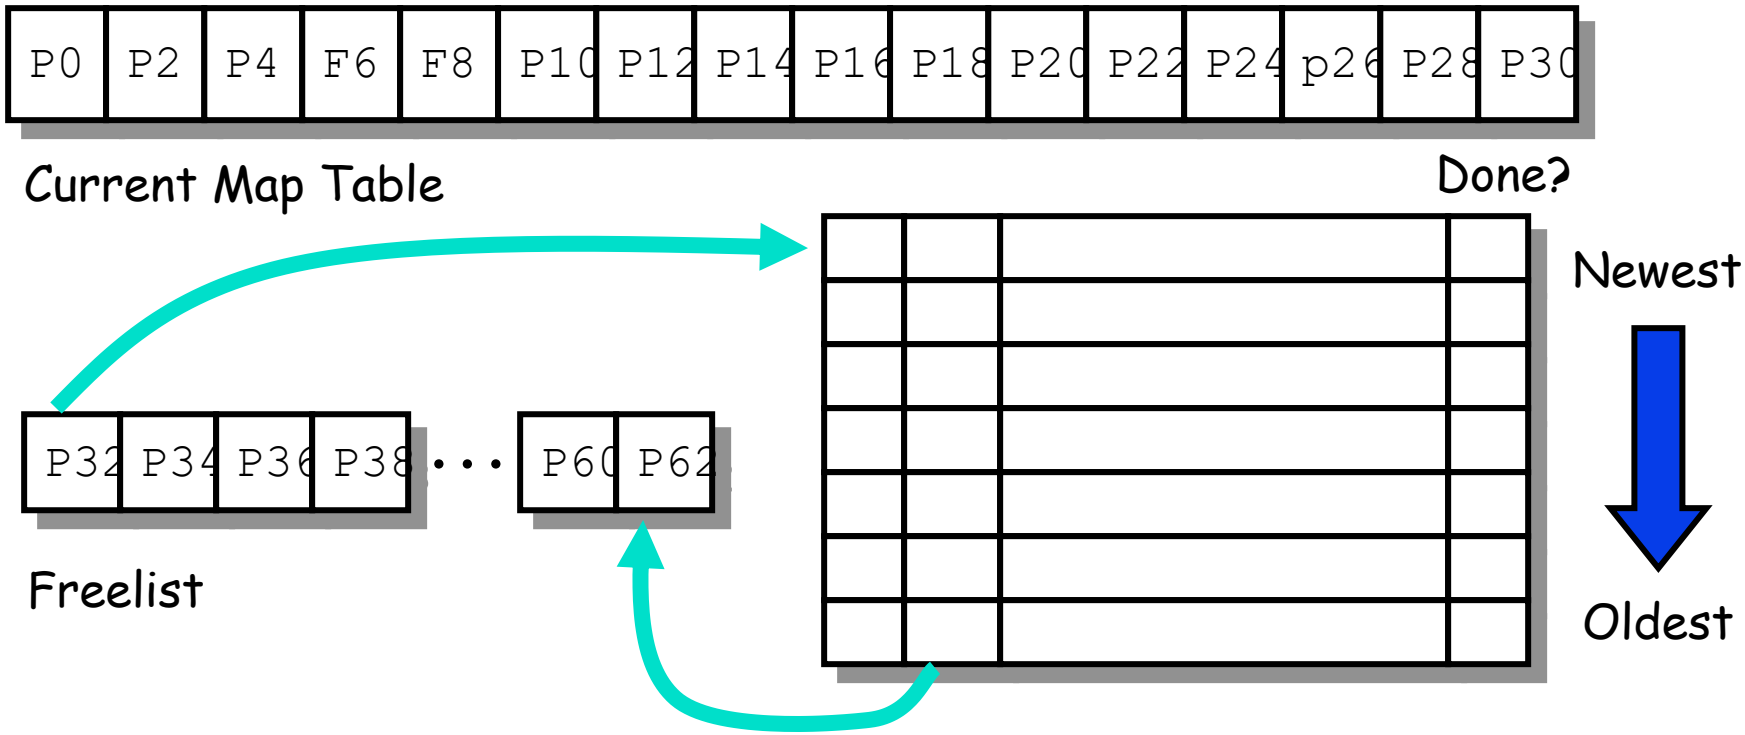
- Technique for both precise interrupts/exceptions and speculation: *in-order completion or commit*
  - This is why reorder buffers in all new processors

Explicit Register Renaming

- Make use of a *physical* register file that is larger than number of registers specified by ISA
- Keep a translation table:
  - ISA register => physical register mapping
  - When register is written, replace table entry with new register from freelist.
  - Physical register becomes free when not being used by any instructions in progress.

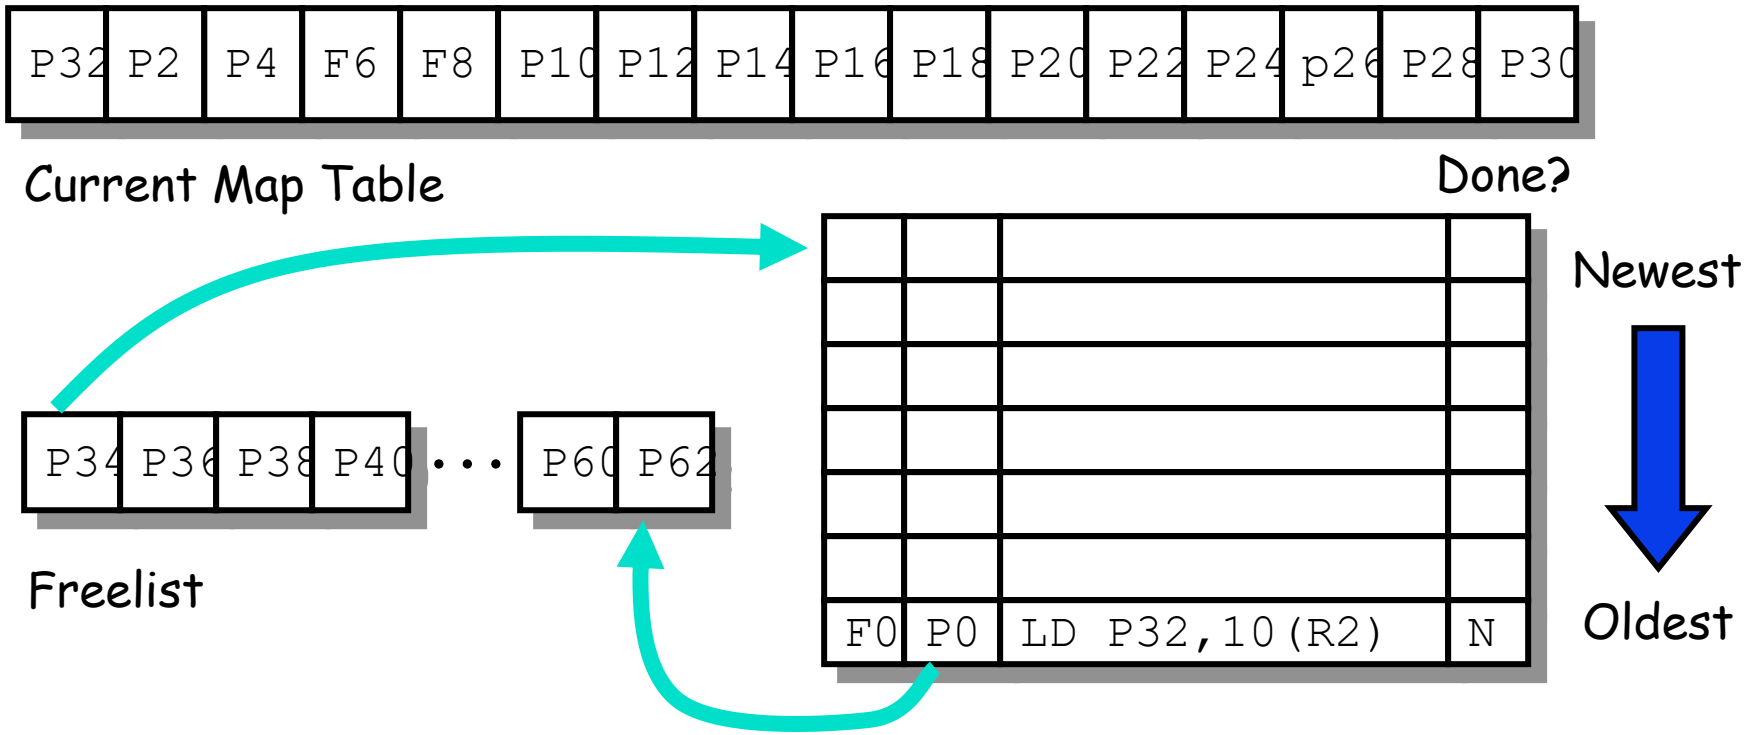


Explicit register renaming:
R10000 Freelist Management



- Physical register file larger than ISA register file
- On issue, each instruction that modifies a register is allocated new physical register from freelist
- Used on: R10000, Alpha 21264, HP PA8000

Explicit register renaming:
R10000 Freelist Management



- Note that physical register P0 is "dead" (or not "live") past the point of this load.
  - When we go to commit the load, we free up

Advantages of Explicit Renaming

- Decouples *renaming* from *scheduling:*
  - Pipeline can be exactly like "standard" DLX pipeline (perhaps with multiple operations issued per cycle)
  - Or, pipeline could be tomasulo-like or a scoreboard, etc.
  - Standard forwarding or bypassing could be used
- Allows data to be fetched from single register file
  - No need to bypass values from reorder buffer
  - This can be important for balancing pipeline
- Many processors use a variant of this technique:
  - R10000, Alpha 21264, HP PA8000
- Another way to get precise interrupt points:
  - All that needs to be "undone" for precise break point is to undo the table mappings
  - Provides an interesting mix between reorder buffer and future file
    - Results are written immediately back to register file
    - Registers *names* are "freed" in program order (by ROB)

Summary

- Scoreboard: Track dependencies through reservations
  - Simple scheme for out-of-order execution
  - WAW and WAR hazards force stalls – cannot handle multiple instructions with same destination register
- Reservations stations: *renaming* to larger set of registers + buffering source operands
  - Prevents registers as bottleneck
  - Avoids WAR, WAW hazards of Scoreboard
  - Allows loop unrolling in HW
- Dynamic hardware schemes can unroll loops dynamically in hardware
  - Form of limited dataflow
  - Register renaming is essential
- Lasting Contributions of Tomasulo Algorithm
  - Dynamic scheduling
  - Register renaming
  - Load/store disambiguation
- 360/91 descendants are Pentium II; PowerPC 604; MIPS R10000; HP-PA 8000; Alpha 21264
